CL-2005: Database Systems

Lab # 7: HTML CSS + JavaScript

Task 1:

In this lab, students will create a simple interactive web page using basic HTML and JavaScript. First, create an HTML file named **i24xxxx.html**. The webpage should contain a heading titled **"My First Web Page"** and a short paragraph introducing yourself, such as your name, interests, or hobbies. Below the paragraph, add a text input field where a user can enter their name and a button labeled **"Greet Me."**

Using JavaScript, make the button interactive so that when the user enters their name and clicks the **"Greet Me"** button, a message appears on the page saying **"Hello, [Name]! Welcome to your first webpage."** If the user clicks the button without entering any name, the page should instead display the message **"Please enter your name!"** This will help practice using JavaScript to read input values and update content on the webpage dynamically.

Improve the appearance of the webpage by applying basic **CSS styling**, such as changing the background color, text color, and adding a hover effect to the button. This task will help students understand how **HTML structure, JavaScript interactivity, and basic styling** work together to create a simple web application.
