Employee-Department Management System

Objective: Develop a web-based Employee-Department Management System using HTML, CSS, PHP, MySQL, and JavaScript (where required).

Requirements:

1. Table Viewer Implement a dropdown menu that lists all tables in the database. Upon selecting a table, the system should fetch and display all records from that table in a structured format.

2. Full Database View with Joins Provide a button that, when clicked, displays the entire database by joining all the tables in your database. NULL values must be handled gracefully.

3. Employee Search by ID Include a search feature that allows the user to look up an employee by their Employee ID and display all associated data for that employee, including information from related tables or a specific table if selected.

4. CRUD Operations The system must support the following operations on the Employee-Department database:

- **Search** — Query records based on given criteria
- **Insert** — Add new employee or department records
- **Update** — Modify existing records
- **Delete** — Remove records from the database

5. Object-Oriented Design Define a dedicated PHP class for each database table. Each class must encapsulate the data fields of its corresponding table and may include relevant methods.

6. Modular Code Structure All functionalities must be implemented as separate, reusable functions. Avoid writing monolithic code; each operation (connect, fetch, insert, update, delete, display, etc.) must reside in its own function.

7. Code Documentation Every function, class, and major code block must include clear and meaningful comments explaining its purpose and logic.

8. Applied PHP Concepts Your implementation must demonstrate the use of the following PHP concepts covered in class:

- Selection statements (if, else, switch)

- Loops (for, foreach, while)
- Arrays (indexed and/or associative)
- Functions
- Object-Oriented Programming (classes, objects, properties, methods)

Submission Notes:

- Your code must be well-organized and readable.
- The interface should be functional and user-friendly, even if minimal in styling.
- Use proper naming scheme: (***i231234_A_Lab10.zip***)
