Lab Task #09

Structured Query Language (SQL)

Run following queries using NORTHWIND Database:

1. Write a query that declares a variable for storing an employee's full name and assigns it the full name of the employee with employee_id 1. Output the full name.
2. Declare a variable for the maximum salary allowed in the company, assign it a value of 100000, and print this value.
3. Create a query that checks if the HireDate of the employee with EmployeeID = 3 is before '1995-01-01'. If true, print "Long-time employee"; otherwise, print "New employee."
4. Write a query that retrieves the Title of the employee with EmployeeID = 4 and uses a CASE statement to output a description based on the title.
5. Write a query that uses a WHILE loop to print the EmployeeIDs of the first 5 employees in the Employees table.
6. Create a loop that iterates through employees and use a break condition to exit the loop if an employee's HireDate is after '1990-01-01'. Output the employee's EmployeeID and HireDate.
7. Write a query that declares a variable for storing the number of orders placed by the employee with EmployeeID = 2 and prints this count.
8. Write a query that retrieves the Country of a customer with CustomerID = 'ALFKI' and uses a CASE statement to categorize the region as 'Europe', 'Asia', or 'Other' based on the country.
9. Write a query that creates a labeled loop to print the ProductIDs of the first 5 products from the Products table, and demonstrates how to structure a labeled block of code.
10. Write a query that demonstrates the use of GOTO by skipping a section of code that prints a message and jumps to a labeled section that prints "This section was reached."
11. Write a query that retrieves the number of orders placed in 1997 and categorizes them as 'Low', 'Medium', or 'High' based on the total number of orders using a CASE statement.
